Front end development: Basics

JavaScript – Object methods

The following exercise contains the following subjects:

◆ Objects

Instructions

1. Create an object called 'mycountry' for a country of your choice, containing properties 'country', 'capital', 'language', 'population' and 'neighbours' (an array)

2. Add a **method** to the object called 'describe' to the 'myCountry' object. With the help of the 'this' keyword, this method will log a string like this to the console:

'Finland has 6 million people, their mother tongue is Finnish, they have 3 neighbouring countries and a capital called Helsinki'.

3. Call the 'descrbie method'.

4. Add a **method** called 'checkIsland' to the 'myCountry' object. This method will set a new property on the object, called 'isIsland'.

'isIsland' will be true if there are no neighbouring countries, and false if there are. Use the ternary operator to set the property.
