Backend: Express

Node JS – Express and React

The following exercise contains the following subjects:

- ◆ express
- ◆ react

Instructions

Lets finally combine the backend and frontend!

Either combine the following:

Andrew's weather app code along with a CRA app.

In the course Andrew created the views with handlebar and accessed the API from the browser by a simple js file.

I know we skipped handlebars but regardless in this exercise we will remove all the views coming from handlebars and lets create a "create react app" that will be our views and access the API through our react app.

Reuse our express weather app with the same weather route logic, utility functions except all the views that were handled with handlebars, let react handle them.

Or

Your api exercise with a Create React App.

Or

Your movie app with a Create React App.

1. Connect express with your react app.

2. Send a "get/post" request to our back-end server from our react app.

3. Display the data in our app.

4. Do not waste time styling your UI.

There are plenty of googling we need to do which we haven't covered yet. So go for it!
