Front end development: Basics

JavaScript – Basketball score

The following exercise contains the following subjects:

◆ Order Of Operation

◆ If statements

Instructions

John and Mike both play basketball in different teams. In the latest **3** games, John's team scored **89, 120** and **103** points, while Mike's team scored **116, 94** and **123** points.

1. Calculate the average score for each team

2. Decide which teams wins in average (highest average score), and print the winner to the console. Also include the average score in the output.

3. Then change the scores to show different winners. Don't forget to take into account there might be a draw (the same average score)

4. EXTRA: Mary also plays basketball, and her team scored **97, 134** and **105** points. Like before, log the average winner to the console.

5. Like before, change the scores to generate different winners, keeping in mind there might be draws.

Submit the file to Hive.
