# Front end development: Callbacks

JavaScript – callback function

The following exercise contains the following subjects:

◆ callback functions

**Instructions**

1. Write a a function called 'isString' that receives 2 arguments, a string and a callback function.

The function checks that the string is indeed a string.

If the string is a string, pass the string to a callback function which logs that string to the console.

2.  Create a function called 'firstWordUpperCase' that receives 2 arguments, a string and a callback function.

The function will capitalize the first word in the sentence and pass the string to a callback function which will create dashes between the words.

3. Call the 'firstWordUpperCase' function with a callback of your choice.

4. Create your own function that will receive from one of its arguments a callback function.
